Precautionary action is a concept that has been widely discussed in the environmental policy literature. In the United States, the concept has been applied to a variety of environmental problems, including the regulation of hazardous waste, the regulation of pesticides, and the regulation of air pollution. The concept is based on the idea that where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent or abate the damage. This concept is often referred to as the "precautionary principle" or the "precautionary approach."
